## **DETAILED ACTION**

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

## Claim Rejections - 35 USC § 103

2. Claims 1, 4, 6-8, and 11-23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Bateman et al. (U.S. Patent 5,884,032) in view of Kilander et al. (U.S. Patent 5,742,675) and further in view of Rao (U.S. Patent 6,614,896).

Regarding claim 1, Bateman et al. teach the steps of: connecting a telephony server (Fig. 1, 28) between a user station (Fig. 1, 2) and a call center (Fig. 1, 24) via a telephone switching network, the call center in communication with at least one agent station (Fig. 1, 12); connecting a browser server to the telephony server and the user station and the agent station (Fig. 1 and col. 5, lines 2-34); a user issues a request for a call-back (col.5, lines 35-37 and col. 6, lines 1-30), bridging a callback between the agent and the user (col. 6, lines 52-60 and col. 10, lines 58-67).

However, Bateman et al. do not teach a telephony server is used to call the call center and wait for an available agent. The availability of the agent being determined by detecting a DTMF ID entered when an available agent answers the phone.

Kilander et al. teach a method and apparatus for automatically distributing calls to available logged in call handling agents. A call handling agent logs on to his/her computer at his/her workstation. The call center server (CCS 20) processes the log-on transaction, acknowledges a valid log-on to the agent workstation. When the agent is

Art Unit: 2642

ready to take a new call, the agent signals his/her availability to the CCS 20 by entering a command on the agent's computer and sending it over data link 26 to the CCS 20 (Fig. 2, 62, 64 and Fig. 3, 104, 106 and col. 6, lines 12-32). For example, the agent enter agent ID via DTMF. Kilander et al. do not teach a telephony server is used to call the call center and wait for an available agent.

Rao teaches an advertising system / server for callers to busy numbers. As soon as the called party becomes free the advertisements server calls back to the originator and connect the originator to the called party (abstract, col. 4, lines 30-34).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to incorporate the features mentioned above, as taught by Kilander and Rao, into Bateman's system in order to provide customer service support, and more particularly to a call back system wherein the customer does not have to wait on hold to speak to an agent, and having a telephony server to call the call center and wait for an available agent when the call center does not have call back capabilities.

Regarding claim 4, Bateman et al. teach the request for call back comprises a telephone number to be user for the call back (col. 6, lines 17-10). Bateman et al. further teach the request for call back comprises and interest leads (col. 5, lines 42-43) reads on claimed the request for call back comprises a problem. Bateman et al. do not teach matching the available agent to the problem. Obviously, in order to handle customers' call efficiently, it is necessary to match the available agent to the problem.

Claims 6 and 23 are rejected for the same reasons as discussed above with respect to claim 1. Furthermore, Bateman et al. teach the system comprising: a call

Art Unit: 2642

center (Fig. 1, 24); at least one agent station (Fig. 1, 12) connecting to at least on agent and the call center (col. 2, lines 42-57), telephony server (Fig. 1, 28). Bateman et al. do not explicitly suggest storage for storing phone numbers to be called back and a corresponding problem. Obviously, in order to there is a need for storage to store phone numbers to be called back and a corresponding problem. Obviously, in order to there is a need for a storage in order to store the phone number at which the customer can be reached and further to store customers' problems.

Regarding claim 7, Bateman et al. teach a user station (Fig. 1, 12) where the user issues a request for a call-back from a web page via a browser (col. 6, line 1-30); receiving the request from the user and placing a call to a call center (col. 6, lines 31-35); routing the call and the customer is connected to the agent (col. 6, lines 52-60).

Regarding claim 8, Bateman et al. teach a personal computer (Fig. 1, 4).

Claims 11-15 are rejected for the same reasons as discussed above with respect to claims 1 and 4. Furthermore, Bateman et al. teach several computer hardware and software configurations are needed (col. 11, lines 13-40).

Claims 16 and 17 are rejected for the same reasons as discussed above with respect to claims 1 and 6.

Regarding claim 18, Bateman et al. teach initiating a co-browsing session between the available agent and the customer (col. 6, lines 55-60).

Regarding claims 19 and 20, Bateman et al. teach the agent and customer are viewing the same multimedia screen, and the agent can take order and/or provide

Art Unit: 2642

technical support (col. 6, lines 55-60), for example, customer billing information, and therefore the customer's web page is available to the agent.

Claim 21 is rejected for the same reasons as discussed above with respect to claim 1. Rao does not explicitly suggest whether a call center being with or without call back capabilities. Rao's system would work whether or not the call center has or does not have call back capabilities, since the advertisements server with an automatic call back facility handle the call back to the caller when the called party is available.

Regarding claim 22, Bateman et al. teach the World Wide Web servers are used to allow customers to access information from an organization. It would have been obvious that if a user has an account then it would have been helpful for accounting purposes to also include an account number besides a call back number.

## Response to Arguments

- 3. Applicant's arguments with respect to claims 1, 4, 6-8, and 11-23 have been considered but are most in view of the new ground(s) of rejection.
- 4. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Quynh H. Nguyen whose telephone number is 703-305-5451. The examiner can normally be reached on Monday Thursday from 6:30 A.M. to 5:00 P.M.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ahmad Matar, can be reached on (703) 305-4731. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Art Unit: 2642

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-305-4700.
